

## '32-'34 - Rear Anti-Roll Bar

CPP's '32-34 rear anti-roll bar has been designed to bolt on to TCI '32-34 frames. This unit may be adapted to most other frames by installing a similar tubular rear crossmember.

A Torsion bar mount bolts to rear crossmember using coil-over shock bolts on inboard mounting holes. Outer mounting holes must be drilled.

B Torsion arms should be timed (mounted in

the same position on both ends of the bar) and then connected the upper hole in the 4-Link bracket with the special bolt/stud, spacer and rod end links as shown.
